## The right choice can make the difference

In 1956 Strub Swiss Tribology started to develop the first Metal Working Fluids (MWF) in Switzerland and since then every year new or modified products have been produced. The worldwide audience of Strub MWF users is getting bigger and bigger because of the flexibility, the experience and the ability to produce tailor made products.

But the users of MWF's are getting more demanding because of the high quality and complex materials they have to produce. It is all about special metals: Duplex, super duplex, hastelloy and acid-proof metals. The answer will be the biobalanced STRUB Stabillo Cut 2 EP. Since years the product outperforms the competition all around the world. For the client only big savings can make the difference. STRUB Stabillo Cut 2 EP does it through increased longevity of tools, fewer production stops and additional performance.

A comment from a Norwegian Strub client: „You may not think about it, but when we do some calculations, we experienced that we have twice the longevity of the tools, or more. In addition, we were surprised that the new coolant also is cheaper than the coolant we were using before.”
